

Exam Mini Project: Local AI and Software Development

Task

Use the data from part 1 and select a problem domain that you are interested in.

Use an appropriately downloaded Model and install it locally.

Develop a solution that can communicate with the model through the API of the model and show some answers to your problem domain.

You should Demonstrate that you can develop an application that can make use of the model to answer your problem domain. You should demonstrate that you can select a model depending on what you need. You should also demonstrate that you can develop software that can make use of local AI.

In the exam you will have a chance to present your work, answer questions about your project and also more generally about what the advantages and disadvantages of different local AI models as well as how it is different from developing your own model from the bottom.

Deliverables

- comparative analysis of this solution and AI generated solutions.
- Code for your project as well as a short document that details how you set it up together with what model and how you setup your local model as well as what settings is relevant for your code to communicate with that model
- For the exam you will need a 10 minute presentation explaining and reflecting on the project but you will not need to hand in the presentation.
